Sprint 3 — Presentation Script

Who says what, slide by slide. Target **10–12 minutes** including two live demos.

The speaker split below is a suggestion based on your roles — change the names if your split differs. Only the `@@` lines need editing.

Who covers what

SPEAKER	ROLE	SLIDES	APPROX.
Shafiullah Anik	Scrum Master	1, 13	1½ min
Albin Roy	Product Owner	2, 3, 6, 7	3 min
Mushfiqur Rahman	Lead Developer	4, 5, 8, 9, 10	6 min
Merajun Nabi	Tester	11, 12	1½ min
All four	—	14 (questions)	—

Handover rule: finish your last sentence, say the next person's name, and step back. Every section below ends with the cue to use.

Setup before you start: slides open in Presenter View, the site in a second tab, the admin dashboard signed in on a third. Do the browser reset in the Demo Runbook.

Slide 1 · Title

Shafiullah Anik SCRUM MASTER

> *"Good morning. This is Sprint 3 on the Pedagogy Evaluation Platform. We delivered three things this sprint: optional demographic collection, a much bigger admin dashboard, and proper validation on survey completion."*

> *"I'll hand over to Albin to cover what we were asked for, then Mushfiqur will show you the build working, and Merajun will cover testing."*

Don't linger — the title slide is not where the value is.

→ **Hand to Albin.**

Slide 2 · Four requirements

Albin Roy PRODUCT OWNER

> *"These four came out of the sprint planning meeting. R1 demographics, R2 the dashboard, R3 validation, and R4 verify it all by testing."*

Don't read the slide aloud — let them read it, and summarise in one line.

> *"I'll take R1 and R2 in a moment. Mushfiqur takes the technical side."*

Slide 3 · All four delivered

Albin Roy PRODUCT OWNER

> *"All four are done and verified. The build is ready for formal testing."*

> *"We'll also be straight with you about what's still outstanding at the end — there are a few items, and one of them is a database step we run before release."*

Signalling honesty early buys credibility for everything after it.

→ **Hand to Mushfiqur.**

Slide 4 · Validation

Mushfiqur Rahman LEAD DEVELOPER

> *"Before this sprint, if you hadn't answered a question the Next button was just greyed out. No explanation. Now you're told why."*

> *"At the end there's a review screen showing all twenty answers. If any are missing, submission is refused and it names exactly which ones."*

> *"The important part is the third point. There is a single gate in the code — nothing is scored, stored or emailed until all twenty questions have an answer. A half-finished survey cannot reach the database."*

Slide 5 · Live demo one

Mushfiqur Rahman LEAD DEVELOPER — DRIVING

Switch to the site. Acts 1 and 2 of the Demo Runbook. **Budget 3 minutes.**

1. Answer two questions.
2. On the third, click **Next** with nothing selected → the error appears.
3. Select an answer → the error clears.
4. Click **Review answers** → show the grouping and the red incomplete rows.
5. Click **Submit** → refused, missing questions named.
6. Finish fast with keys **1**–**5** and **Enter**, then submit.

> *"Notice the buttons are held for a moment — 'saving your results'. Merajun will explain why when he covers what we found in testing."*

If you overrun, skip step 6 by having a completed run ready in another tab.

→ **Hand to Albin.**

Slide 6 · Demographics, asked once

Albin Roy PRODUCT OWNER

> *"After finishing, the participant is asked once whether they're happy to give demographic details. Yes goes to a page, no goes straight to results. Either way they're one click from their results — the optional step never blocks them."*

> *"Three fields. And every single one has a 'prefer not to say' option, so we never force anyone to disclose anything."*

Slide 7 · Linked to the response

Albin Roy PRODUCT OWNER

This slide answers the actual requirement. Slow down here.

> *"The requirement said the demographics must be linked to the same survey response — so they're stored against the same record as the scores."*

> *"The second point is the one I'd highlight. We record declines as well. If we didn't, we could never report an opt-in rate, because someone who said no would look identical to someone who was never asked."*

> *"Third, the record is write-once. There's no update or delete permission, so even with a session ID nobody could alter another participant's answers."*

→ **Hand to Mushfiqur.**

Slide 8 · Eight numbers

Mushfiqur Rahman LEAD DEVELOPER

> *"The dashboard now has the four counts that were asked for by name, plus four more. What mattered here was defining them, because 'participants' could mean several different things. Each one on screen has a stated definition."*

If asked why started and completed differ:

> *"Someone can open the assessment and not finish. That gap is the completion rate."*

Slide 9 · Categories and demographics

Mushfiqur Rahman LEAD DEVELOPER

> *"The category chart now has a table under it — mean, median, lowest, highest. Both read the same set of sessions, so they can't drift apart and show different numbers for the same thing."*

> *"Three demographic charts, and the demographic columns are in the CSV export so the data can be analysed properly outside the tool."*

Slide 10 · Live demo two

Mushfiqur Rahman LEAD DEVELOPER — DRIVING

Switch to the site. Acts 3 and 5 of the Demo Runbook. **Budget 3 minutes.**

1. Demographics page — submit empty to show validation, then fill it in.
2. Switch to the admin tab. Walk the two bands of statistics.
3. Category table, then the demographic charts.
4. Click a participant row → the profile with their demographics.
5. Export CSV, open it, show the new columns.

> *"One thing worth mentioning — we found sessions that matched no participant record were being dropped from the totals entirely. Those now appear as unattached sessions, so the participant count is honest."*

→ **Hand to Merajun.**

Slide 11 · Four defects

Merajun Nabi TESTER

Don't rush this. Finding your own defects is a strength, not an admission.

> *"We ran a structured review over the new code before it came to testing, and found four problems."*

> *"The first is the one worth knowing about. The database client reports failures by return value rather than by throwing an error, and that wasn't being checked. So a failed save looked like a success, and the participant was told their results were saved when they weren't. That's fixed — it only says saved now when the database actually confirms it."*

> *"The second one is why those buttons were held during the demo. Navigating away was cancelling the save mid-flight."*

Slide 12 · What we verified

Merajun Nabi TESTER

> *"Scores were checked against a manual calculation, not just eyeballed. The dashboard counts were checked by hand against a known data set."*

> *"The dashboard also degrades properly — if the demographics table isn't there yet, it still loads and tells you why, rather than breaking."*

> *"There's a written test script covering every one of these, and I'll be working through it formally next."*

→ **Hand to Shafiullah.**

Slide 13 · Outstanding items

Shafiullah Anik SCRUM MASTER

Say these plainly. Do not apologise for them.

> *"Four things remain. The database migration is written and reviewed, and gets run before release. Then formal testing. Then deployment, after test sign-off — we don't publish straight to the live site."*

> *"And the results email still points at a development address so we're not sending test data out. That switches before we recruit real participants."*

> *"Next sprint, the obvious step is cross-tabulating scores against demographic groups — which is the analysis this data was collected to support."*

Slide 14 · Questions

All four — whoever owns the area takes the question

Route by topic: requirements and scope to **Albin**, anything technical or about the build to **Mushfiqur**, testing and defects to **Merajun**, timeline and process to **Shafiullah**.

Likely questions, and honest answers

"Is it live yet?" — Mushfiqur or Shafiullah

> *"No. It's complete and verified locally, and goes live after testing signs off. We don't push straight to the live site."*

"Is the demographic data anonymous?" — Albin

> *"It's attached to the assessment record, not to a name. Anonymous participants can provide it without an account. It isn't anonymised in the formal research sense — a registered participant's record could be linked back to their account — so if the study needs true anonymity, that's a design decision we should make deliberately."*

"Why require an answer if the whole thing is optional?" — Albin

> *"The step is optional — you can decline it entirely, or skip it on the page. But if you're on the page we ask for a definite choice, and 'prefer not to say' is always one of them. That gives clean data without forcing disclosure."*

"What if someone closes the browser halfway?" — Mushfiqur

> *"Their answers are kept on the device and they resume where they left off. Nothing is scored or stored on the server until all twenty are answered."*

"How many participants can it handle?" — Mushfiqur

> *"We haven't load-tested it. It's a static site against a hosted database, so the front end scales fine — but the honest answer is we don't have a number, and we'd need to test if you're expecting a large cohort."*

"Can we cross-tabulate scores by age group?" — Albin

> *"Not yet. That's the obvious next step now the demographic data exists, and it's first on our list for the next sprint."*

"How long did this take?" / "Are you on track?" — Shafiullah

> *"Sprint 3 is complete on scope. The remaining items are sequenced, not blocked."*
